Automated Pre-Use Checkout

1. Turn INOmax DS$_{IR}$ ON, verify speaker function.

   Note: A low range calibration automatically starts following the self test.

   A Pre-Use wizard will be displayed on the main screen, which will provide step-by-step instructions to complete the automated Pre-Use procedure.

   - Pressing the NEXT button initiates the Pre-Use wizard.
   - Pressing the CANCEL button exits the Pre-Use wizard. If you cancel the pre-use wizard, the manual pre-use checkout procedure can be found on the INOmax DS$_{IR}$ Plus Pre-Use card, or in the INOmax DS$_{IR}$ Operation Manual, section 9/Appendix.

   The Pre-Use wizard can also be initiated by entering the menu screen and selecting the Pre-Use Checkout button.
(Intentionally left blank)
Note: Use the integrated pneumatic backup function only for a short time, until a replacement delivery system can be obtained. The INOblender can also be used as a backup.

If the main delivery system fails, the INOmax DS_{IR} has an integrated pneumatic backup delivery function that allows the patient to remain connected to the ventilator. Backup NO delivery does not rely on the operation of the main system.

The INOmax DS_{IR} backup function:
· Uses a pneumatic on/off switch and a restrictor built into the delivery side of the system.
· Provides a fixed flow of INOMAX (250 mL/min) into the injector module. This fixed flow provides 20 ppm of NO when added to a continuous ventilator gas flow of 10 L/min.

**WARNING:**
When using the integrated pneumatic backup with breathing circuit gas flows of 5 L/min, the delivered NO dose will be approximately 40 ppm. Breathing circuit gas flows less than 5 L/min will deliver an NO dose greater than 40 ppm.

The table below indicates the nominal concentrations delivered for different ventilator gas flows.

<table>
<thead>
<tr>
<th>Ventilator/Gas Flow (L/min)</th>
<th>5</th>
<th>7.5</th>
<th>10</th>
<th>15</th>
<th>20</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO Concentration (ppm)</td>
<td>40</td>
<td>27</td>
<td>20</td>
<td>13</td>
<td>10</td>
</tr>
</tbody>
</table>

INOOMAX cylinder conc. X 0.25 L/min / ventilator flow = estimated dose
The main screen:

· Indicates that backup delivery is on and that the set dose is turned off.

· Displays the estimated dose that the patient should be receiving, based on the ventilator flow.

· Displays the NO concentration table

Note: If the injector module is not functioning, the estimated backup dose graphic will be inactive.

Backup delivery mode ON (with a Low Priority alarm).

Backup delivery mode OFF.
Transport Regulator/Cap Assembly

WARNING:
• A new INOMAX cylinder and regulator must be purged before use to ensure the patient does not receive an excess level of NO₂.

• Loss of communication between the INOmax DS IR and the INOMAX cylinder for more than one hour will result in interruption of INOMAX delivery.

Caution: When using the Transport Regulator/Cap Assembly (PN 10022) ensure the cap is in place on the cylinder and the infrared cable is connected to the infrared connector port on the back of the INOmax DS IR.

Note: Check the INOMAX cylinder for the correct product identity labels, cylinder concentration and expiration date. Ensure the INOMAX gas cylinder has more than 500 psig.

Step One
Note: Ensure the white plastic tip is in place on the regulator connector and not chipped or cracked (see Figure 2).

Connect a high pressure regulator to an INOMAX cylinder and tighten the fitting to the INOMAX cylinder (see Figure 1).
Step Two
Connect the INOMAX regulator hose to one of the INOMAX inlets on the back of the INOmax DS_{IRR} (see Figure 3).

Step Three
Connect the Infrared cable from the Transport Regulator/Cap Assembly to the back of the INOmax DS_{IRR} (see Figure 4).
Step Four

Place the Cap Assembly over the INOmeter (see Figure 5).

Note: Be sure to align the keyway inside the Cap Assembly with the iButton on the INOmeter (see Figure 5 and 6).

Step Five

Grasp the Cap Assembly to open cylinder valve (see Figure 7 and 8).
Final Set-up Diagram
The following diagram and photo illustrates all of the components connected.

Additional Information
Communication will take place between the INOmax DS\textsubscript{IR} and the INOmeter after the boot up phase of the INOmax DS\textsubscript{IR} is complete.

Note: Cylinder icons are not visible and the dose control button will remain inactive until the INOmax DS\textsubscript{IR} recognizes an INOMAX cylinder.

Note: When using the Transport Regulator/Cap Assembly only one cylinder will be displayed (see Figure 9).

Proceed with the INOmax DS\textsubscript{IR} Pre-Use Checkout
(see page 6)
**Oxygen Dilution Chart**

For delivery with 800 ppm cylinder of INOMAX (nitric oxide) for inhalation.

**Actual $\text{FiO}_2$**

⚠️ Caution $\text{FiO}_2$ less than 21%

Please Note:

The calculations on this chart have been determined based on an 800 ppm cylinder of INOMAX (nitric oxide) for inhalation.

This chart is representative of a range of doses available on the INOmax DS$_{IR}$ and doses higher than 20 ppm are not intended as the recommended therapeutic dose.

Calculations are considered estimates and may vary under clinical conditions.

All numbers have been rounded to the nearest hundredth.

</table>

This chart is representative of a range of doses available on the INOmax DS_{IR} and doses higher than 20 ppm are not intended as the recommended therapeutic dose.

* All calculations in the table above are based on a full cylinder, 138 bar (2000 psig), 1963 liter “88” cylinder, with a cylinder change at 14 bar (200 psig). The figures are calculated based on a total continuous breathing circuit gas flow and a cylinder conversion factor of 14.2 liters per bar/0.98 liters per psig.

- INOMAX flow = \([\text{Desired dose} \times \text{total ventilator flow}] ÷ \text{[Cylinder concentration - desired dose]}\]
- Cylinder volume = Cylinder conversion factor × cylinder pressure (bar/psig)
- Cylinder duration (hours) = (Cylinder volume ÷ INOMAX flow rate) ÷ 60

Calculations are considered estimates and may vary under clinical circumstances. For more information, call 1-877-KNOW-INO (1-877-566-9466).

*Typically used in transport*

This chart is representative of a range of doses available on the INOmax DS\textsubscript{IR} and doses higher than 20 ppm are not intended as the recommended therapeutic dose.

* All calculations in the table above are based on a full cylinder, 138 bar (2000 psig), 353 liter “D” cylinder, with a cylinder change at 14 bar (200 psig). The figures are calculated based on a total continuous breathing circuit gas flow and a cylinder conversion factor of 2.6 liters per bar/0.18 liters per psig.

- INOMAX flow = [Desired dose × total ventilator flow] ÷ [Cylinder concentration - desired dose]
- Cylinder volume = Cylinder conversion factor × cylinder pressure (bar/psig)
- Cylinder duration (hours) = (Cylinder volume ÷ INOMAX flow rate) ÷ 60

Calculations are considered estimates and may vary under clinical circumstances. For more information, call 1-877-KNOW-INO (1-877-566-9466).
Proper use of these products depends on careful reading and understanding of labeling and instructions. Please refer to the INOmax DS<sub>IR</sub> and INOblender operation manuals for guidance. Also refer to the specific breathing device operation manual or instructions for use.

**INOmax DS<sub>IR</sub> Warnings:**

- INOmax DS<sub>IR</sub> subtracts gas from the breathing circuit via the gas sampling system at 230 mL per minute; this can affect the sensitivity of a flow triggered synchronized breath mode of some ventilators. The trigger sensitivity of the ventilator should be checked after connecting the INOmax DS<sub>IR</sub> to the breathing circuit.

- Patient disconnect and high-pressure alarms are required for the ventilator.

**INOmax DS<sub>IR</sub> Cautions:**

- Insert the Injector Module on the dry side of the breathing circuit prior to the humidifier (this will ensure correct flow measurement).

- Avoid medications interfering with the gas monitoring system; administer any aerosolized medications distal to the sampling tee.

Bagging Systems While Using the Injector Module

WARNING: To minimize the delivered concentration of NO2, the following steps should be taken for use with the manual resuscitator bags:

- Use the smallest bag adequate to deliver the desired tidal volume.
- Oxygen tubing lengths greater than 72 inches should not be used.
- Use the highest fresh gas flow rate (up to 15 L/min) that is practical.
- Use the lowest practical inspired oxygen concentration.
- After starting fresh gas flow, squeeze the bag several times to empty residual gas in the bag prior to using the system to ventilate a patient.

8. O₂ Tubing Sample Tee
9. Patient Gas Sample Line with Nafion
10. NO/N₂ Injector Tube
11. Resuscitator Bag with O₂ Reservoir
12. Injector Module Electrical Cable
WARNING:

- The hyperinflation bag will, under some conditions, contain NO\textsubscript{2} in excess of 1 ppm. Use of large tidal volume breaths may expose the patients to the NO\textsubscript{2} present in the bag, for part of the breath. In general, if the inspiratory flow rate induced by the manual ventilation does not exceed the fresh gas flow rate, the patient should not be exposed to the concentrations of NO\textsubscript{2} present in the hyperinflation bag.

- Adult and infant hyperinflation bags generate more NO\textsubscript{2} when used at lower minute ventilation. If use of the bag is interrupted (for example, to adjust a tracheal tube), before resuming ventilation of the patient, the user should squeeze the bag several times to empty residual gas from the bag.

- Because of the potential for inhalation of excessive concentrations of NO\textsubscript{2}, and the difficulty in monitoring the peak inhaled NO\textsubscript{2} concentrations, ventilation with a hyperinflation bag or self inflating bag is intended only for short term use.

- The monitoring system within the INOmax DSIR will not detect generation of NO\textsubscript{2} within the hyperinflation bag or self-inflating bag devices and the alarms for excessive NO\textsubscript{2} cannot warn of NO\textsubscript{2} produced within the manual bag system.

- To minimize the delivered concentration of NO\textsubscript{2}, the following steps should be taken for use with the manual resuscitator bags:
  - Concentrations greater than 20 ppm NO should not be used because of excessive NO\textsubscript{2} generation.
  - Use the smallest bag adequate to deliver the desired tidal volume.
  - Oxygen tubing lengths greater than 72 inches should not be used.
  - Use the highest fresh gas flow rate (up to 15 L/min) that is practical.
  - Use the lowest practical inspired oxygen concentration.
  - After starting fresh gas flow, squeeze the bag several times to empty residual gas in the bag prior to using the system to ventilate a patient.

Bunnell Life Pulse
High Frequency Ventilator Circuit

WARNING:

• The INOmax DS\textsubscript{IR} backup mode (250 mL/min.) should not be used with the Bunnell Life Pulse as ventilator flow rates are normally below the recommended ventilator flows.

• Place the Life Pulse in Standby prior to suctioning the patient to avoid NO delivery transiently exceeding the set dose by up to 30 ppm. Press ENTER to reestablish ventilation as soon as the catheter is removed from the airway. This will limit the extent of over delivery above the NO set dose.

Caution:

• If the set dose is below 5 ppm and the Servo pressure is 2.0 psig. or less, this will result in flow rates outside of the specification of the Injector Module and fluctuating NO values may result.

• A one-way valve should be placed between the injector module and the humidifier chamber to prevent water from backing up into the injector module if the Life Pulse is either put into Standby or cycled OFF.

• There are higher pressures in the breathing circuit than normal; use only parts provided in disposable package #50046 and tightly secure all connections.

Spontaneous Breathing Patient on a Nasal Cannula

The INOmax DS\textsubscript{IR} can be used with nasal cannula to deliver INOMAX concentrations from 5-80 ppm and an oxygen flow rate as low as 2 L/min.

**WARNING:** Do not use the INOmax DS\textsubscript{IR} backup mode with flow rates less than 5 L/min.

Connection to the Vapotherm Precision Flow

- The INOmax DS\textsubscript{IR} adds NO/N\textsubscript{2} gas flow to the breathing circuit flow in proportion to the NO setting (up to 10% at 80 ppm) and subtracts gas from the breathing circuit via gas sampling at a nominal flow rate of 0.23 L/min.

- These effects impact the delivered gas flow rate when using the Vapotherm Precision Flow. It is recommended that after an NO setting change the user checks the delivered gas flow rate and adjusts the gas source flow rate as necessary.

- Follow all manufacturer instructions for connection to the Vapotherm Precision Flow.

INOblender Warnings:

• The purge procedure must be followed to help ensure NO₂ is purged from the pressure regulator, INOblender and hoses before the manual resuscitator bag is connected to the patient. The manual bag should be squeezed continuously during use to avoid NO₂ building up in the bag. If the bag is not squeezed continuously while delivering INOMAX, the bag should be removed from the patient and the purge procedure performed before continuing.

• Persons using this device should be trained on and experienced in the use of this device to assure effective administration of INOMAX and to avoid injury to the patient or others resulting from inhalation of excess INOMAX, nitrogen dioxide or other reaction products.

INOblender Cautions:

• Refer to the manufacturer’s procedures for using the resuscitation bag. When finished, turn the INOMAX cylinder off and continue to flow O₂ until the NO pressure gauge reads zero, then turn the O₂ flow off and the NO dial to zero ppm.

Note: Connections to various ventilators as well as their corresponding disposable circuits, are unique to each manufacturer. Please refer to the specific breathing device operation manual or instructions for use for guidance.

Changing INOMAX Cylinders

WARNING:
• A new INOMAX cylinder and regulator must be purged before use to ensure the patient does not receive an excess level of NO₂.
• Loss of communication between the INOmax DS_{IR} and the INOMAX cylinder for more than one hour will result in interruption of INOMAX delivery.

Caution:
• Replace an INOMAX cylinder when its pressure is less than 200 psig.
• When using the Transport Regulator/Cap Assembly (PN 10022) ensure the cap is fully seated and in place on the INOmeter and the infrared cable is connected and latched to the infrared connector port on the back of the INOmax DS_{IR}.

Note: Ensure the white plastic tip is in place.

A. Attach a regulator to an INOMAX cylinder with greater than 500 psig.
B. Perform high pressure leak test.

C. Purge the high pressure hose.

D. Connect the pressure hose.
Changing INOMAX Cylinders (cont.)

E. Open the cylinder valve (this may activate the “Two Cylinders Open” alarm until the empty cylinder valve is closed).

Note: If using the INOmax DS\textsubscript{IR} Transport Regulator/Cap Assembly, transfer the cap from the exhausted INOMAX cylinder to the new INOMAX cylinder at this time; the “Cylinder Not Detected” alarm may occur.

F. Close the cylinder valve on the empty cylinder and remove the hose from the back of the INOmax DS\textsubscript{IR}.

G. Depressurize and remove the regulator from the empty cylinder.
